Problems with the AMH

1. Release any of the Red Emergency Stop Buttons by twisting them to the right. Look for any items that might be stuck under the sensors (the yellow chords that run over top of the AMH).
2. Press the "Power On" button, and the white button will illuminate.
3. Go to the computer where the exception bin is. There will be a pop up window that explains why the system stopped, click the Clear Alarms button at the bottom of the window.
4. Then click the two yellow buttons on the right of the screen.
   a. First click the top button that says "System in Manual, press for AUTO"
   b. Second, click the bottom button that says "System Paused, press for START."
5. If that didn't work call RFID solutions:
